OUR COMPANY

For over 10 years, Piscine Energetics has been removing *Mysis diluviana*, an invasive species found in Okanagan Lake, British Columbia, Canada. Utilizing its private fleet of fishing vessels, Piscine Energetics is the only fishery with the exclusive rights to fish for Mysis at night; as they feed on zooplankton and phytoplankton.

Mysis were introduced to Okanagan Lake in 1966 to provide forage for decreasing salmon populations. Adversely, the Mysis began competing with juvenile salmon for the same food source: zooplankton and phytoplankton. By harvesting Mysis, Piscine Energetics is allowing native salmon populations to return to healthy levels. Salmon are a keystone species for British Columbia's natural ecosystem and are a part of British Columbia's heritage, due to their strong cultural significance within First Nation cultures.

Piscine Energetics is committed to providing the world with environmentally sustainable, naturally sourced, and nutritionally complete aquarium food. Piscine Energetics has revolutionized the ornamental aquaculture and aquarium industry through innovation in aquatic nutrition.
